- auTOMate supports
- ✓ Managing privacy & security requirements per feature
 - ✓ Privacy & security knowledge base
 - ✓ auTOMated export of reports for technical and organizational measures – no more documentation effort!

Pitch: Companies have to be able to show that they employed “appropriate technical and organizational measures” to protect the personal data they hold. That means somebody has to document these measures...
Let’s make this task easier for developers - developers and documentation can be friends!

Basic functional requirements:

- Project & team administration
- Manage privacy/security requirements and knowledge base
- Assign privacy/security requirements to features and track their fulfillment – who, what, when?
- Export a report of the technical and organizational measures – auTOMate them!

Basic non-functional requirements:

- That’s simple: Build the most impressive App in the course! Beautiful, easy to use, stable, you name it!

Expected prior knowledge

- Experience in Web Development, preferably the MERN stack (MongoDB, express, ReactJS, nodeJS)

Highly appreciated prior knowledge

- Any kind of security & privacy engineering knowledge or GDPR knowledge
- Agile software engineering knowledge
- Document generation (e.g. for PDF)
