IT4IT promotes a value-chain based operating model for managing IT business

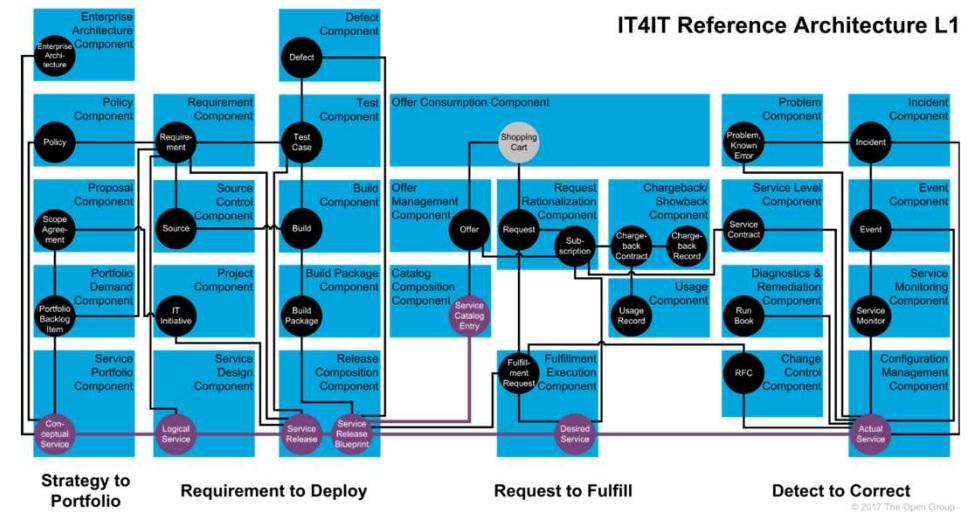

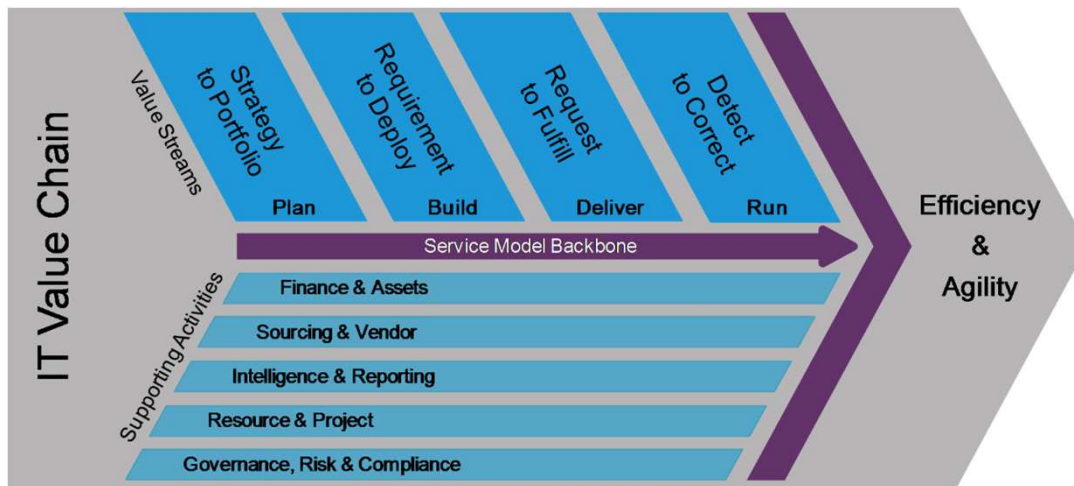

Strategic IT management, planning and transition requires

- a holistic view on the business, provided / consumed services and the underlying IT landscape
- knowledge about the intra- and interdependencies of architectural elements across these layers

→ EAM aims to supports strategic planning, decision making and transformations by modelling the enterprise architecture

But: EA relevant information is generated in various tools along the value chain

→ How to bring the scattered architectural information together?

*IT Value Chain: http://pubs.opengroup.org/it4it/refarch20/chap03.html#_Toc431202723

*IT4IT reference architecture: <http://pubs.opengroup.org/it4it/refarch21/IT4ITv2.1.html>

Agenda

1. Motivation & problem statement

2. Solution concept

3. Thesis goals & research questions

4. Evaluation design and environment

5. Timeline & next steps

Motivation

Enterprise Architecture Documentation (EAD) is a challenge ever since for EAM

- Relevant EA information is scattered across diverse information systems and stakeholders [5]
- Ongoing tracking of changes to keep the model up to date [1, 2]
- EAD is mostly performed manually; often there is no defined process and responsibilities [1]

→ EAD is a time-consuming, cost intensive and error-prone task [1, 2, 3]

Recent trends challenge EAD processes all the more:

- Growing adoption of agile development practices (DevOps, Scrum, CI/CD) [4]
- Growing adoption of cloud- and microservice based environments [4]

Do you use Microservices?

- Microservices are not an option for us.
- We intend to transform our existing software monolith into Microservices.
- We build new components in a microservice style while maintaining our software m...
- We use microservices a lot in our main application.

How far along are you in automating CI/CD?

*<https://jaxenter.com/microservices-trends-2017-survey-133265.html>

**<https://dzone.com/articles/the-top-three-benefits-of-continuous-delivery>

Problem Statement

What the increasing use of cloud- / microservice environments implies:

- Artefacts change faster than ever
- The diversity of technologies used increases
- Runtime artefacts become more volatile

→ The overall architectural complexity increases [3]

Problems faced by practitioners:

- Established EA tools only provide poor support for performing EAD effectively [1]
- Automation has become a must to cope with fast-paced EA environments [1]

→ Insufficient EAD constitutes a major risk for the EAM practice as such and any derived decision

Conclusion: [6, 7]

→ There is a need for automating the EAD process considering

- a) The scattered nature of EA relevant information
- b) The ecosystem of agile practices
- c) The integration of cloud-based environments

Agenda

1. Motivation & problem statement

2. Solution concept

3. Thesis goals & research questions

4. Evaluation design and environment

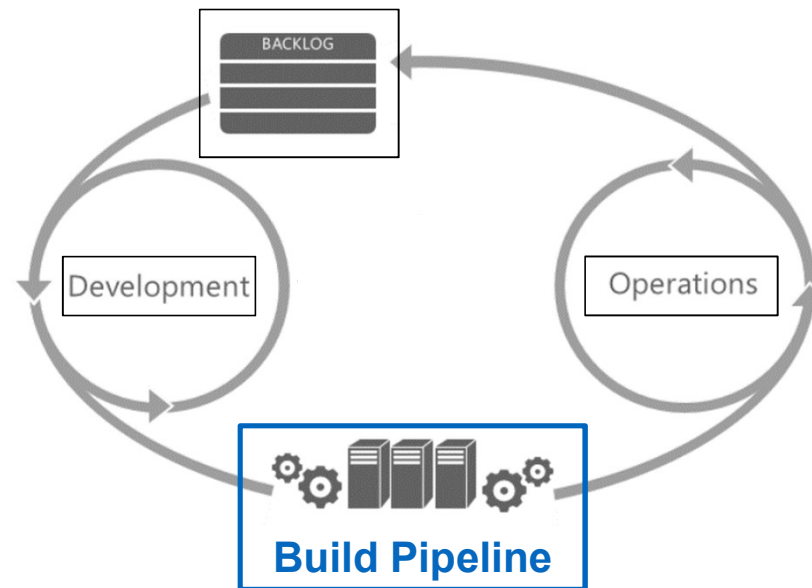

5. Timeline & next steps

Pipeline-based automated EAD solution approach

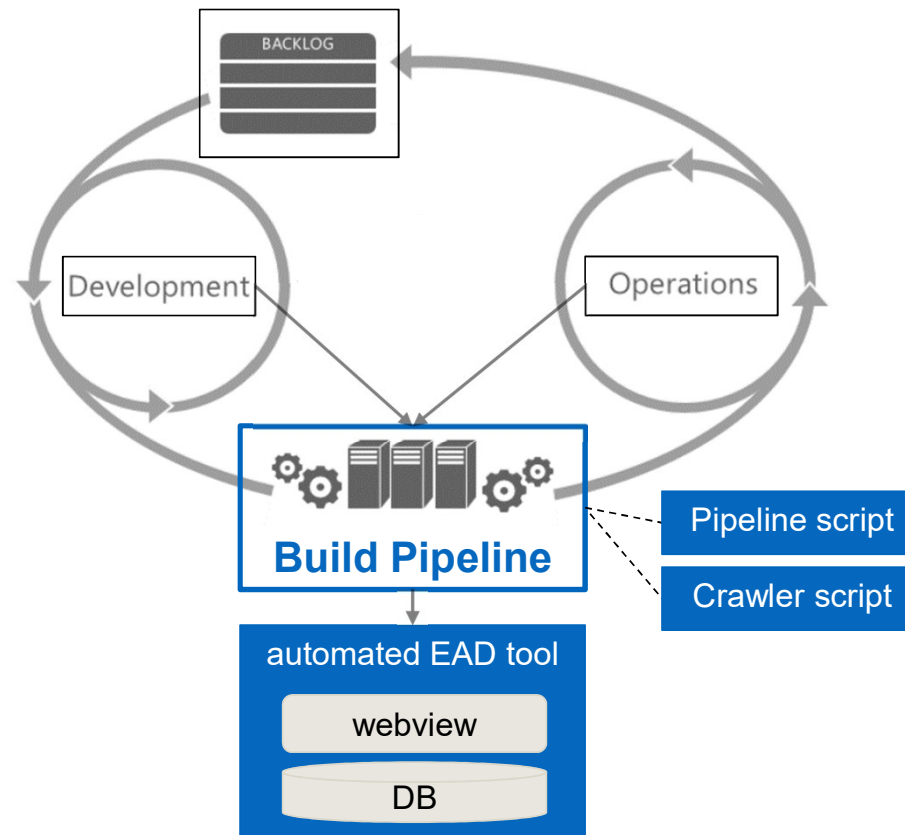

General Idea: integrate the EA discovery process into the build pipeline (CI/CD)

1. CI/CD tool instrumented to conduct automated EAD tasks (new or changed artefacts) with each build
2. Continuously monitor the state of deployed artefacts (runtime information)

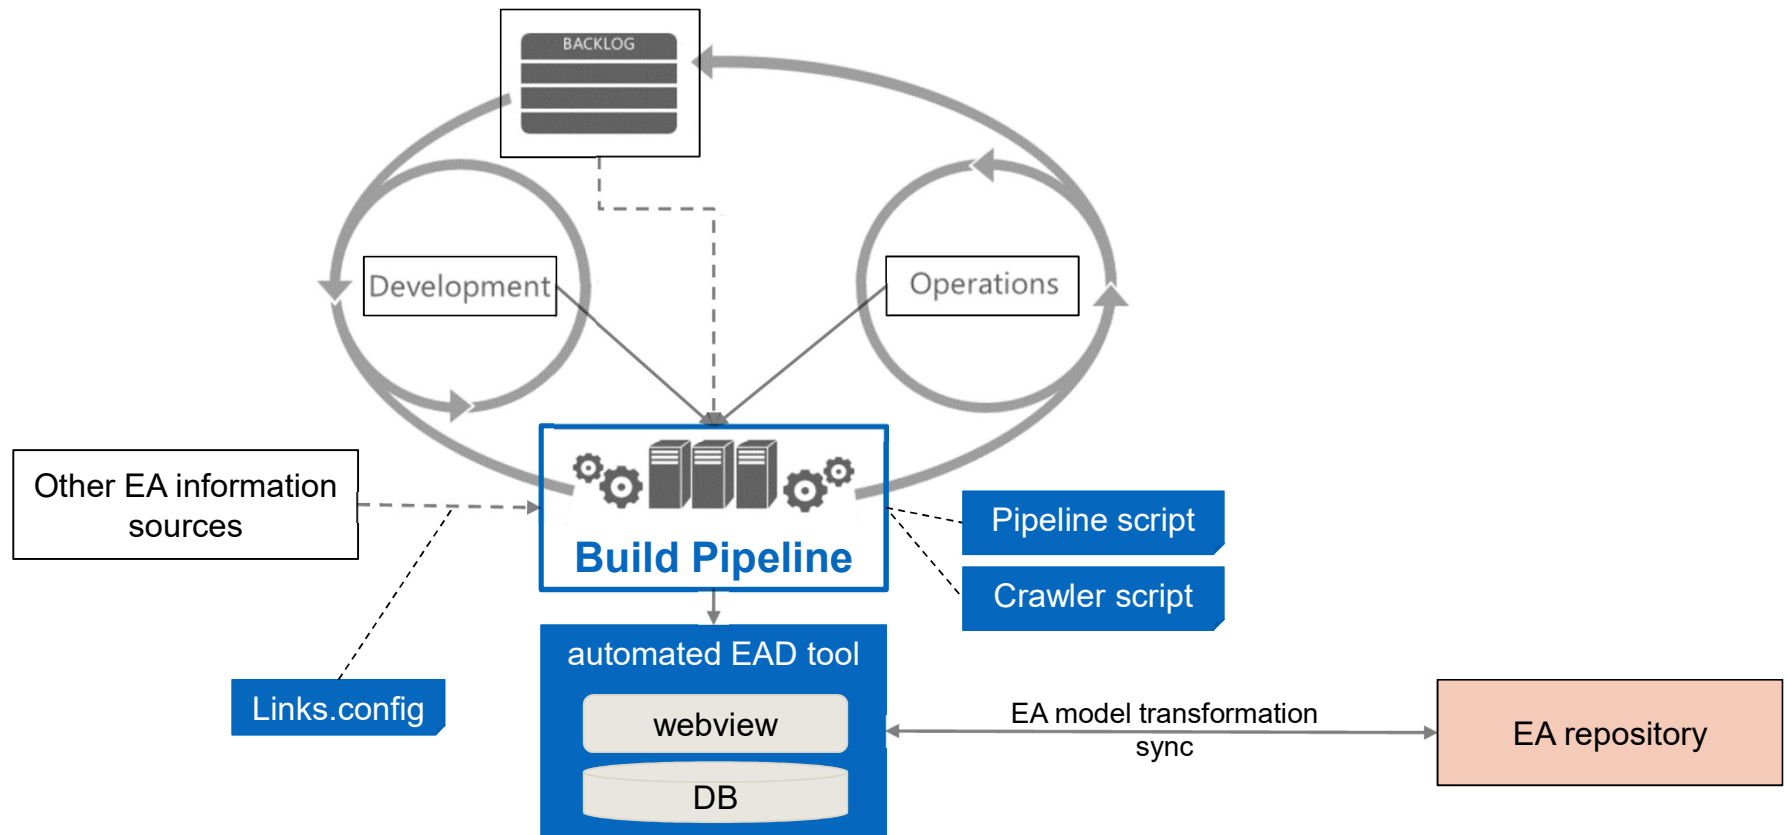

Pipeline-based automated EAD solution approach

- Add to script to the central development pipeline
 - Pipeline script purpose: document EA with each deployment
 - Crawler script purpose: update documented EA continuously

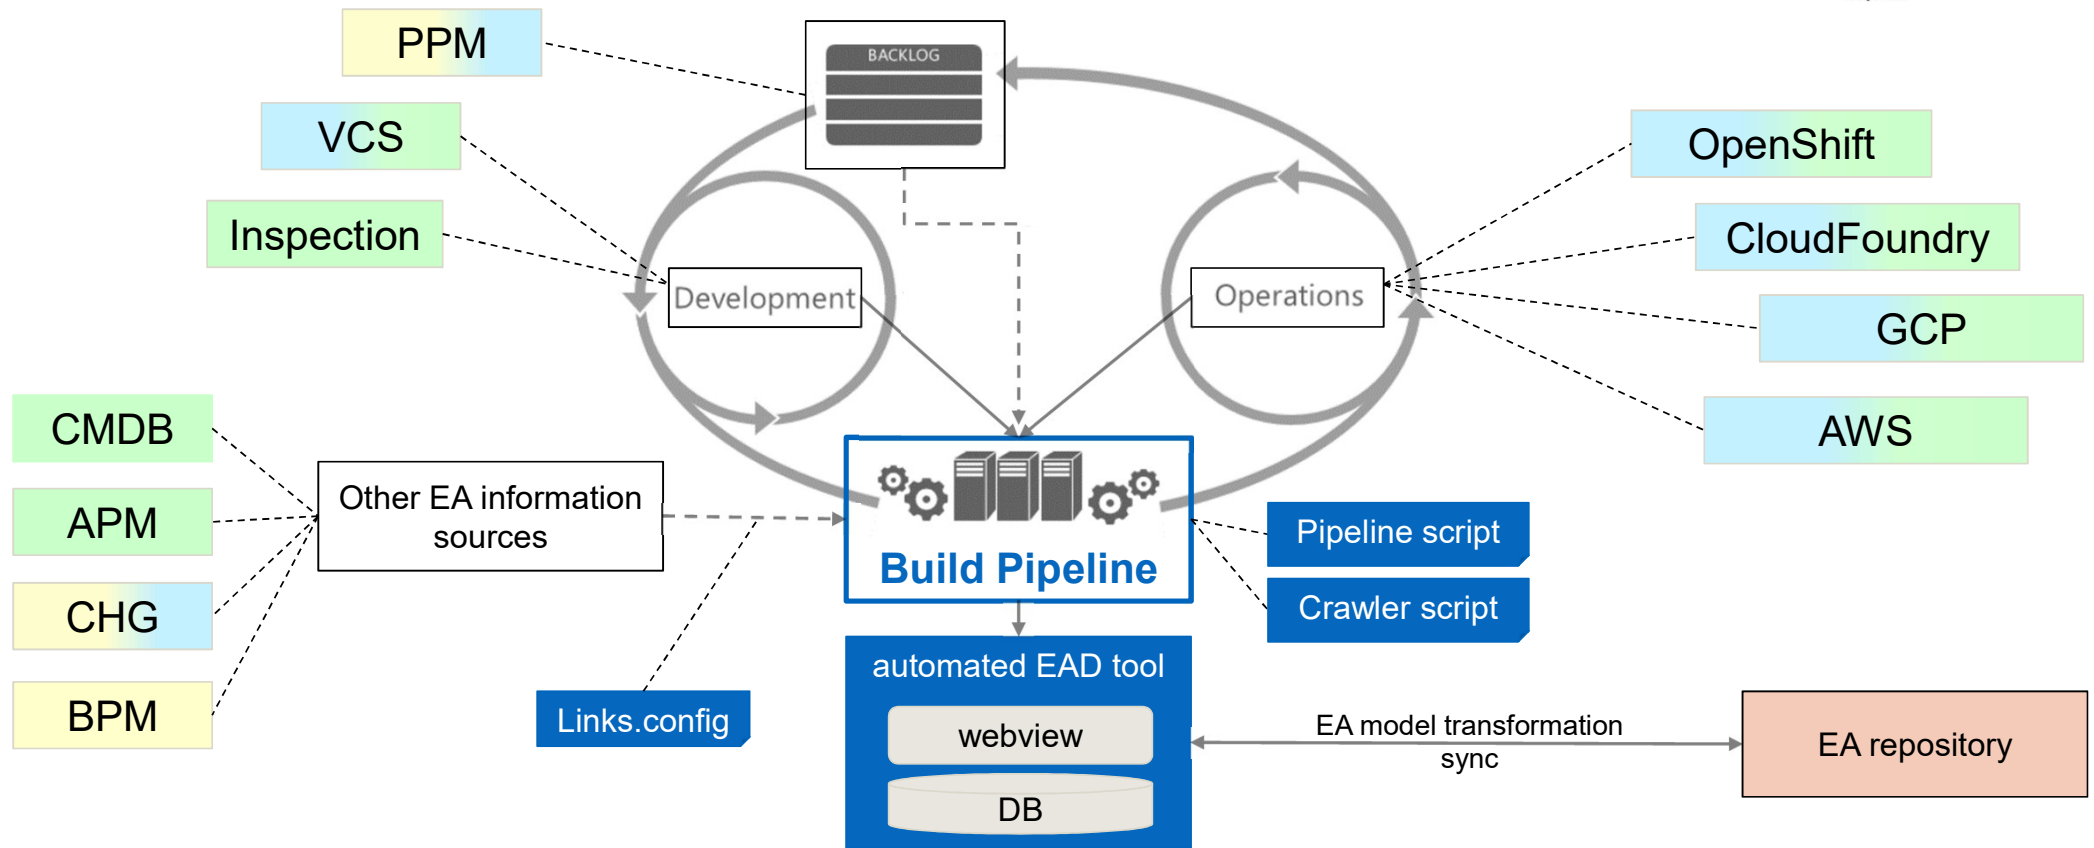

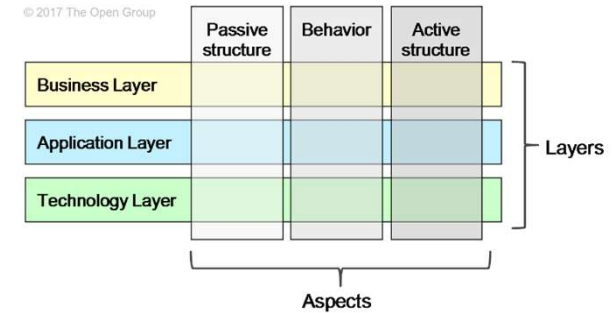

Pipeline-based automated EAD solution approach

- Development teams provides links to federated information sources
 - Pipeline script poll information from federated EA information sources using their API
 - EAD tool aggregates the information gathered and forwards to central EA Repository

Pipeline-based automated EAD solution approach

→ Integrate various relevant EA information sources along the IT4IT value chain (company specific)

PPM = Project Portfolio Management; **APM** = Application Performance Monitoring; **BPM** = Business Process Management; **CHG** = Change Management; **GCP** = Google Cloud Platform

Agenda

1. Motivation & problem statement

2. Solution concept

3. Thesis goals & research questions

4. Evaluation design and environment

5. Timeline & next steps

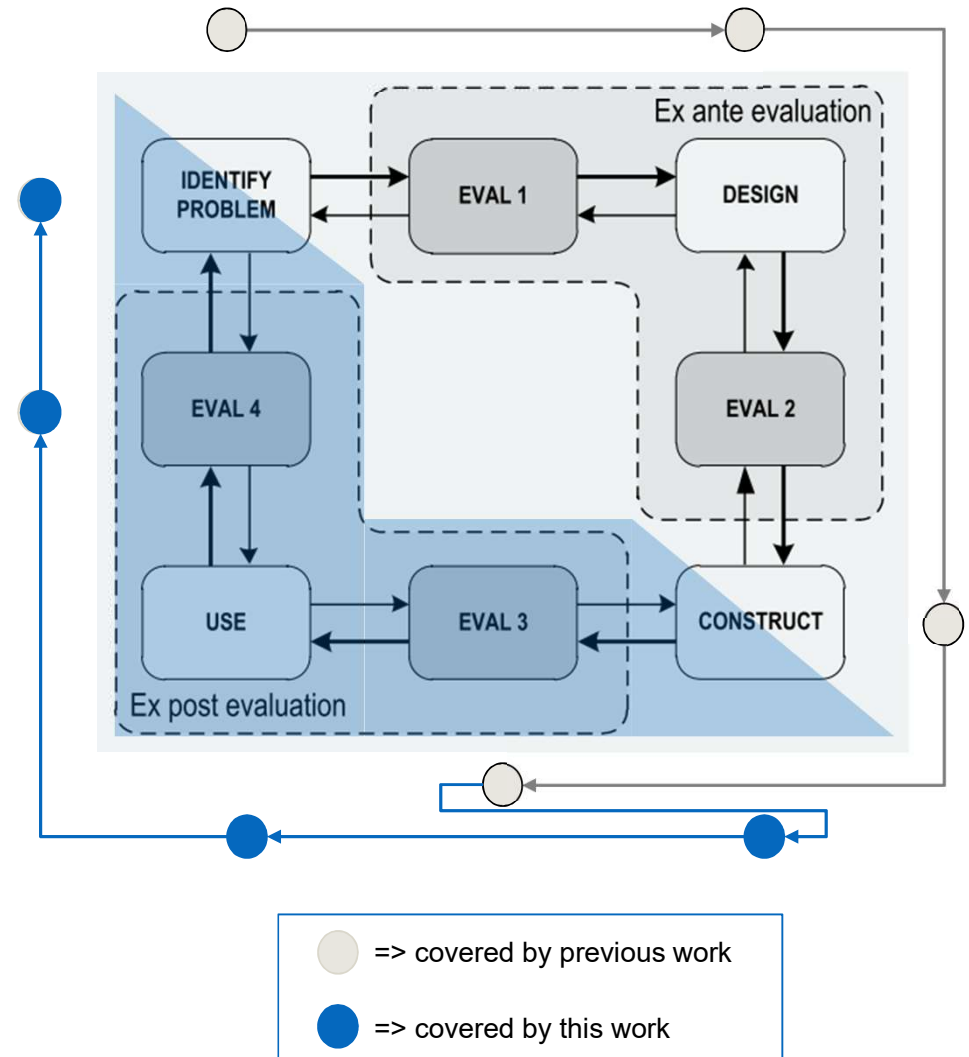

Deliverables and contributions

Deliverables

1. Refine design / Advance the construct based on previous evaluation cycle (EVAL 3)
2. Integration and adoption of the construct to a real case evaluation environment (USE)
3. Conduction of an evaluation (EVAL 4) consisting of
 - a) case study at a industry partner
 - Examine capabilities towards specific EAM use cases
 - Critically assess cost and benefits
 - b) a series of interviews with multiple other EA practitioners

Expected Contributions / Artefacts

1. Refined concept design and construct of the EAD solution approach
2. (dis-)prove of the approaches capabilities, critical assessment of cost and benefits
3. Inferred conclusions w.r. to the general EAM practice

Research Questions

RQ1

What EA model elements can automatically be discovered using runtime information and federated information sources?

RQ2

What challenges/requirements have to be addressed when adopting the proposed EAD solution approach?

RQ3

What are costs* and value proposition for Enterprise Architecture Management?

RQ4

What specific EAM use cases could be enabled using this approach (e.g. cloud fit, cloud governance)?

*refers to non-financial aspects as well

Agenda

1. Motivation & problem statement

2. Solution concept

3. Thesis goals & research questions

4. Evaluation design and environment

5. Timeline & next steps

Evaluation Environment at the industry partner

General IT Organisation:

- App. 1.600 employees
- App. 1.800 applications in use

Agile Development:

- Centrally defined development process
- Centrally defined build / deployment process

Cloud PaaS Environments (on premise) in use:

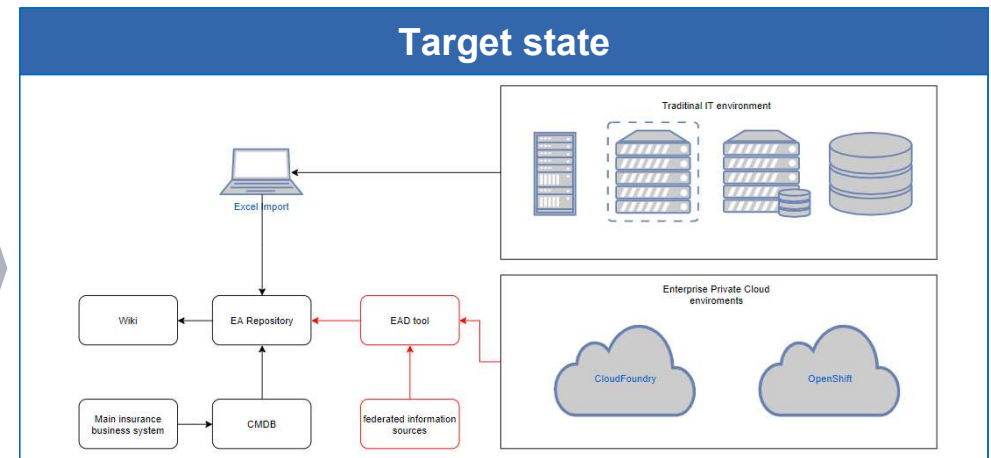

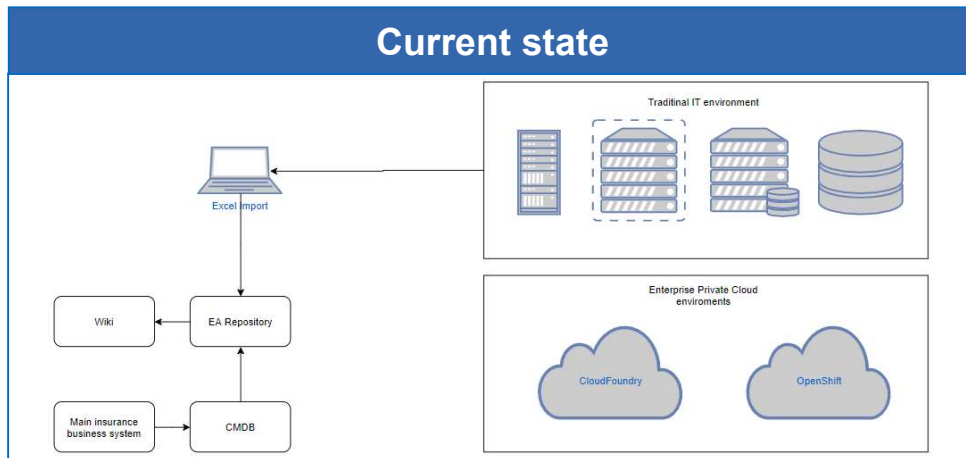

- Pivotal CloudFoundry + Redhat OpenShift
- Total of app. 400 deployed cloud services

Key drivers to adopt:

- External: GDPR, ISO 22301 (BCM), VAIT
- Internal: Cloud Migration Project, BCM, IT Governance

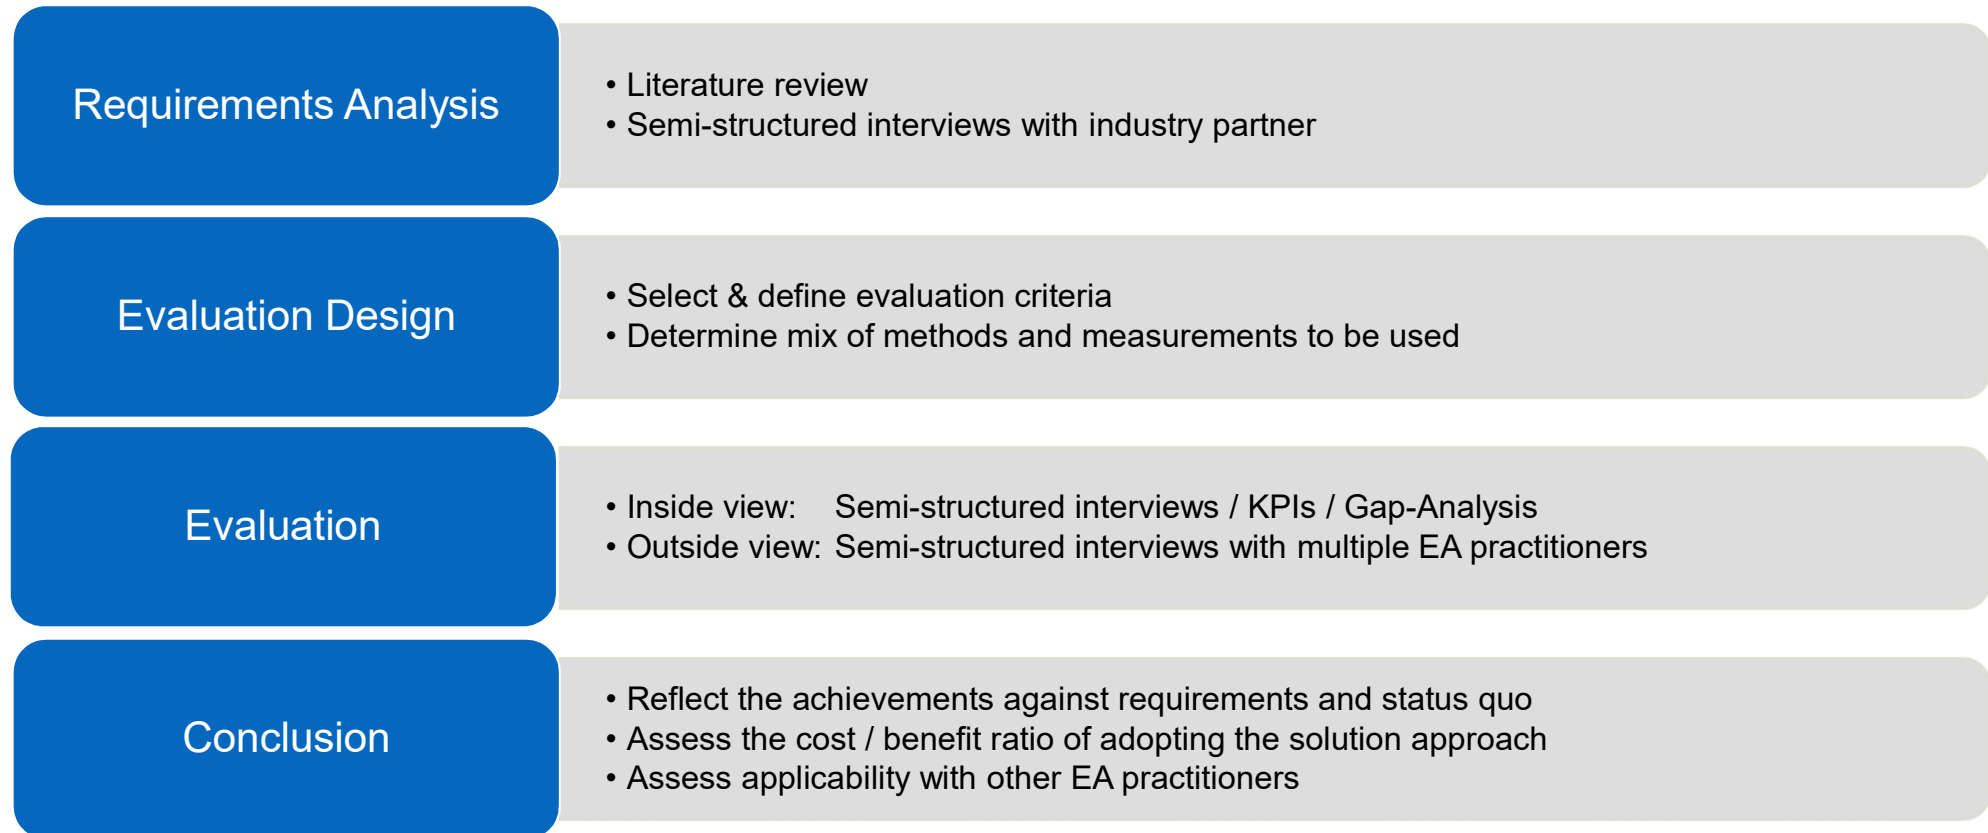

Current EA documentation process for cloud environments:

- Performed manually
- No formal process defined

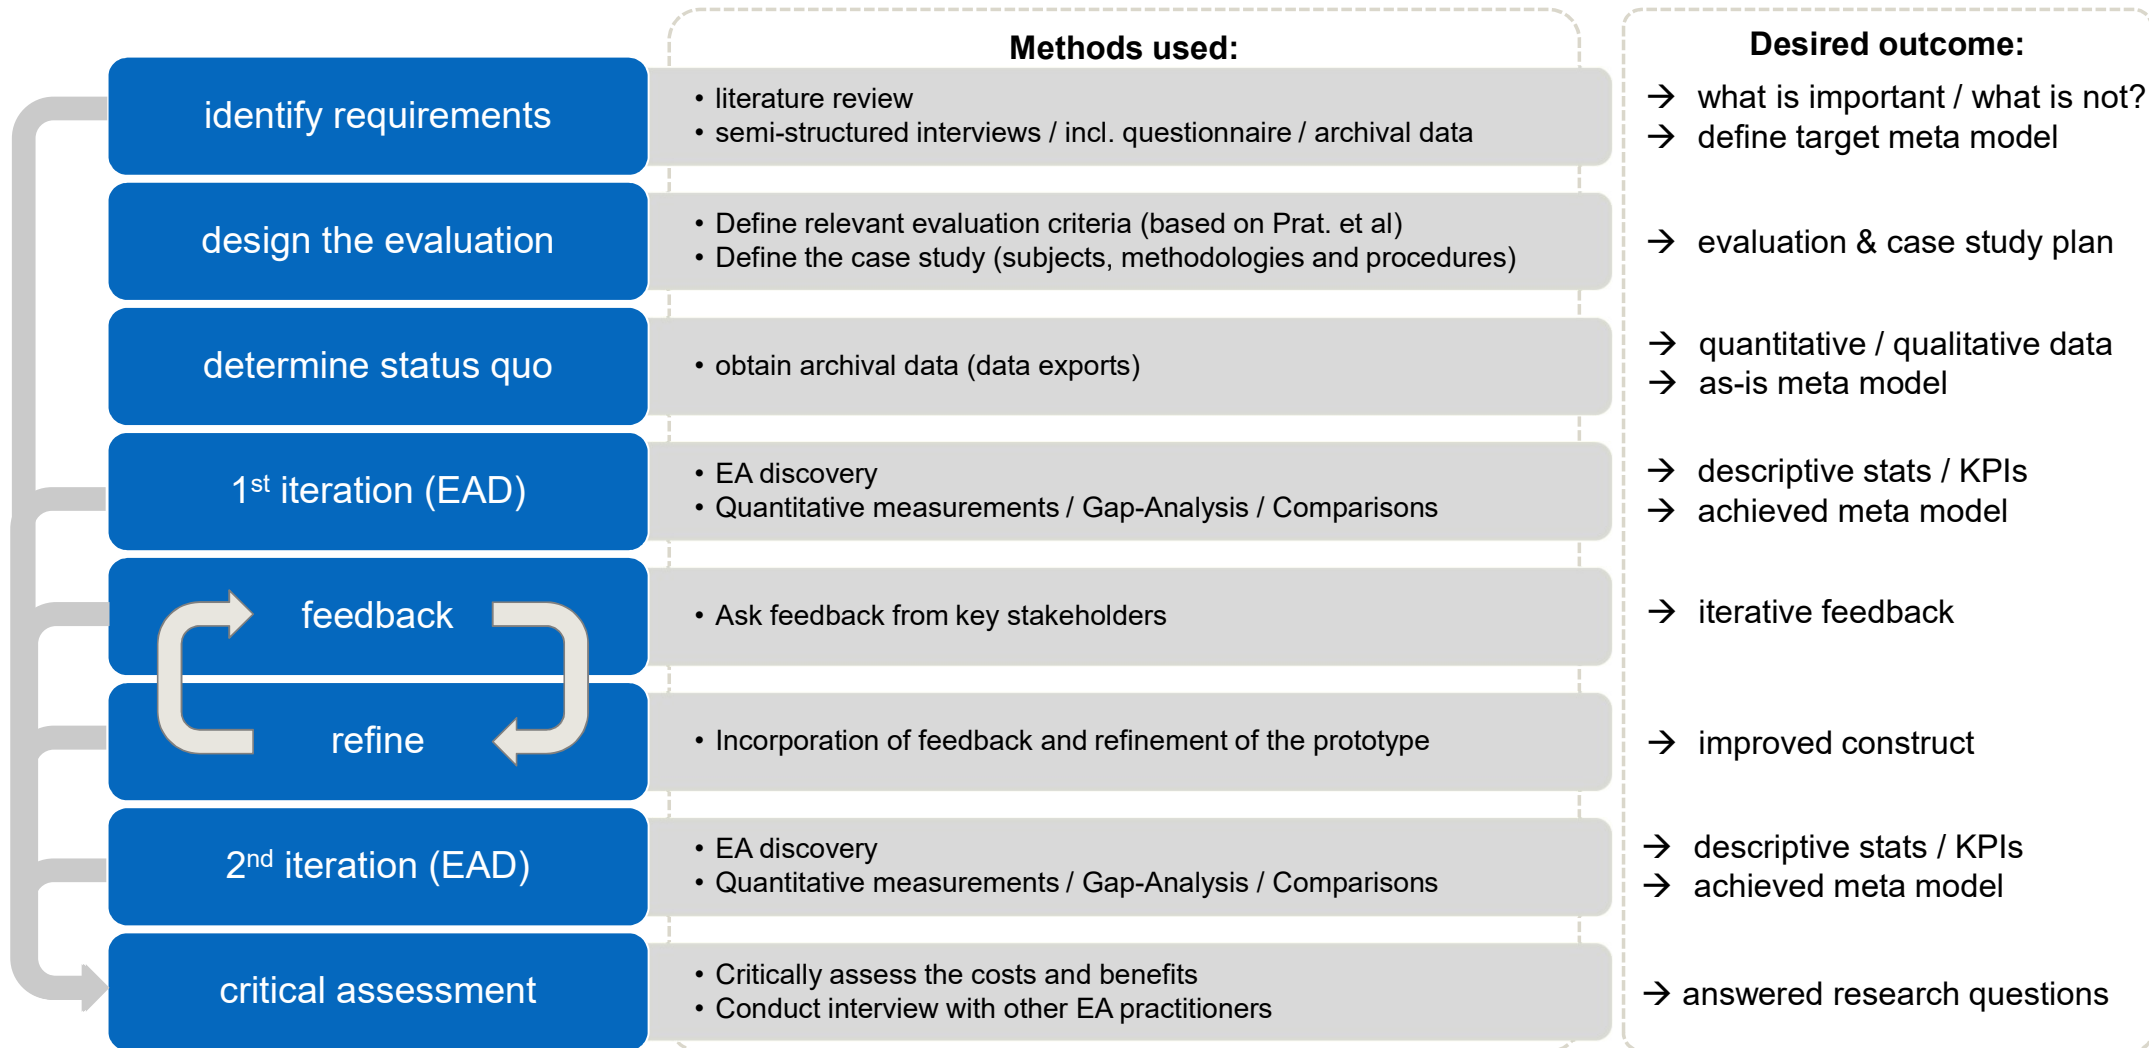

Research Approach – Case Study at a German insurance enterprise

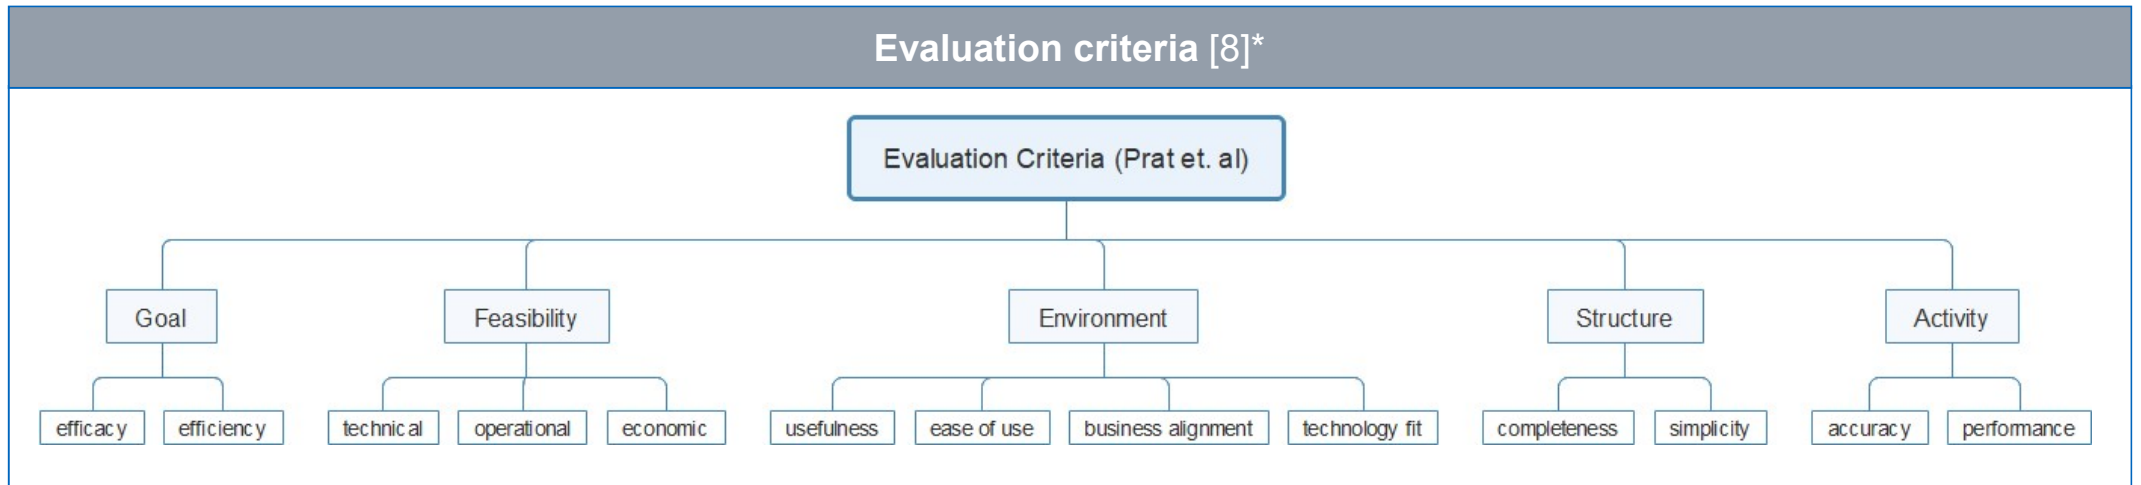

Main building blocks:

Evaluation details

Evaluation aspects & criteria

- Fulfillment of requirements
- Satisfaction of information demand
- Information surplus
- Data quality surplus (accuracy, completeness, consistency, ..)
- Effort reduction due to automation

Benefit aspects

- Preconditions & barriers to adopt
- Limitations
- Side effects on
 - people,
 - processes,
 - organisation (how invasive?)

Cost aspects (also non financial)

*subset of the hierarchy of evaluation criteria acc. to Prat et al.

Agenda

1. Motivation & problem statement

2. Solution concept

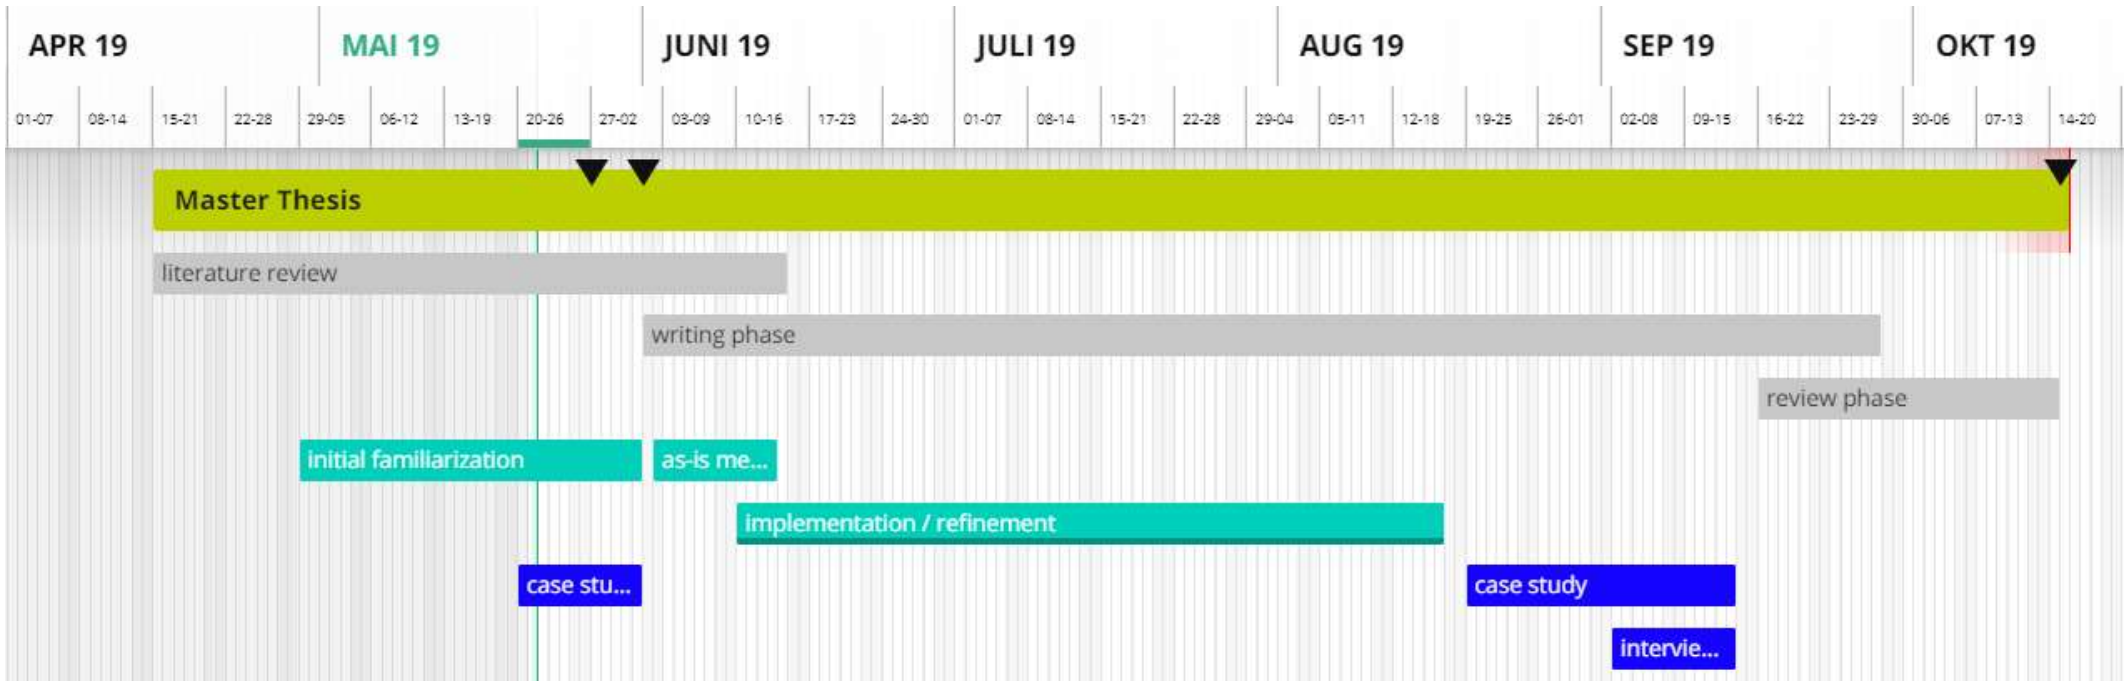

3. Thesis goals & research questions

4. Evaluation design and environment

5. Timeline & next steps

Timeline & Next Steps

In progress:

- Literature review on requirements & challenges of EAD
- Case study design
- Training on the prototype

Next Steps:

- 01.06.2019: Start at the industry partner
- Analyse AS-IS situation and requirements
