

Ein agiler Ansatz zur Dokumentation und Kommunikation von Unternehmensarchitekturen

Software-Architektur Jahrestagung 2011, Hamburg

Prof. Dr. Florian Matthes

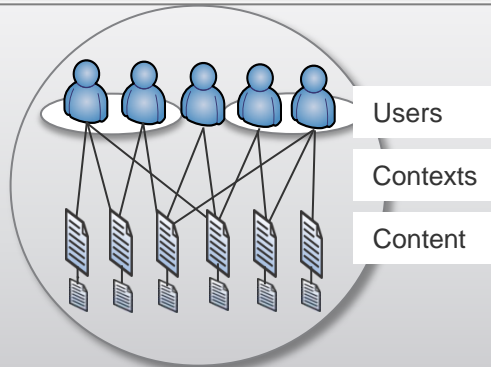

Software Engineering for Business Information Systems (sebis)

Technische Universität München

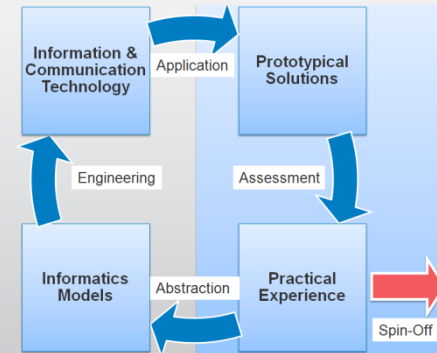

Enterprise Architecture Management – Enterprise Transformation

Social Software Engineering

Transfer Projects

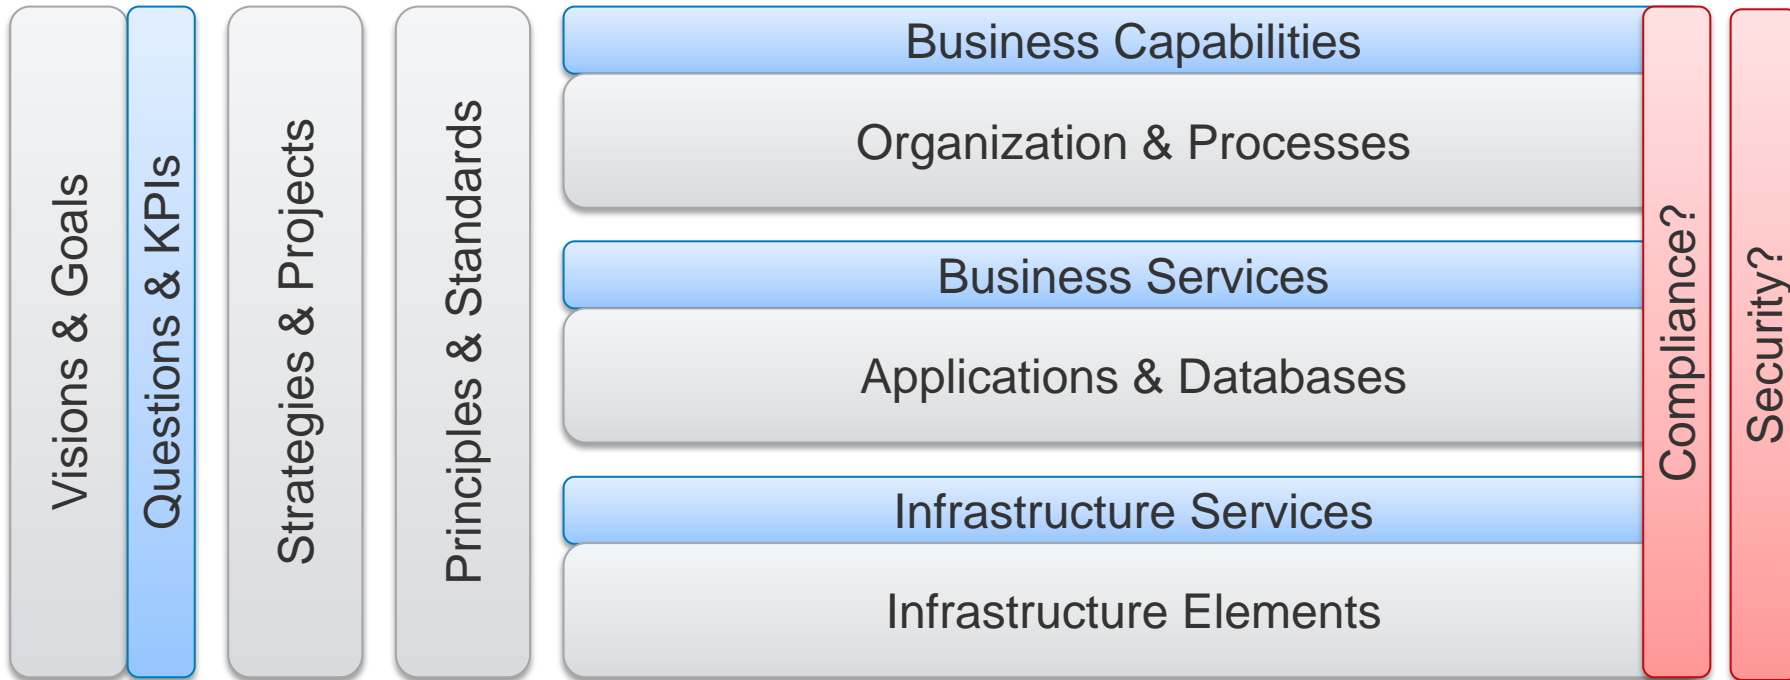

Interactive Information Visualization

What is an enterprise architecture?

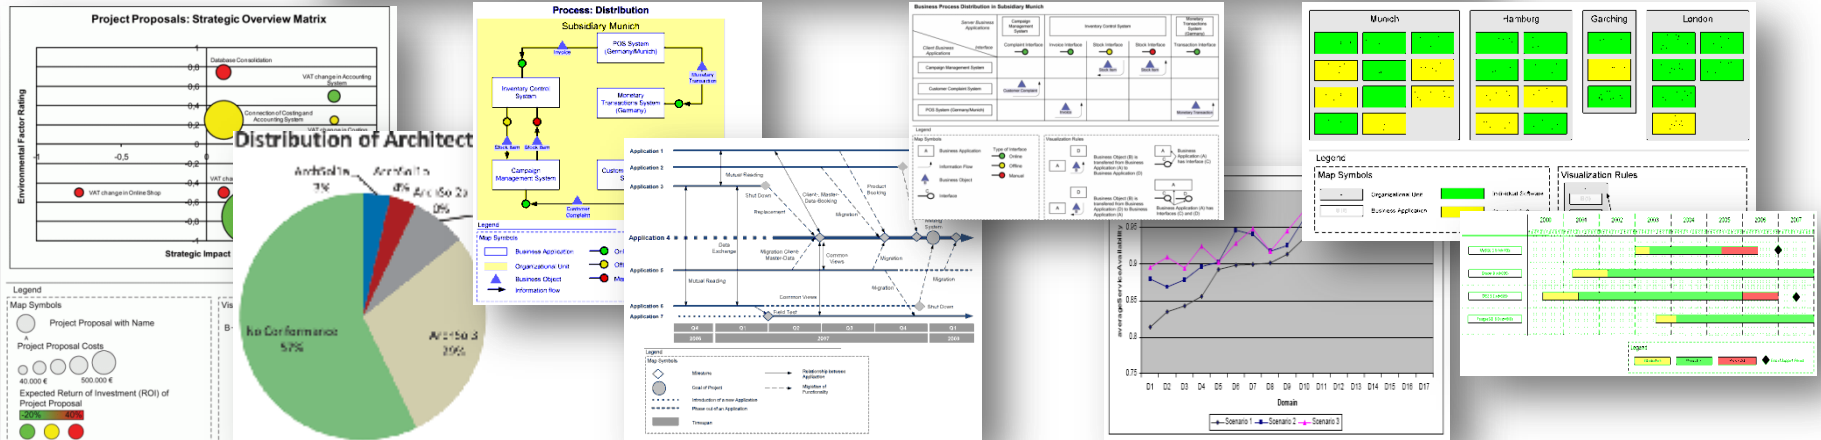

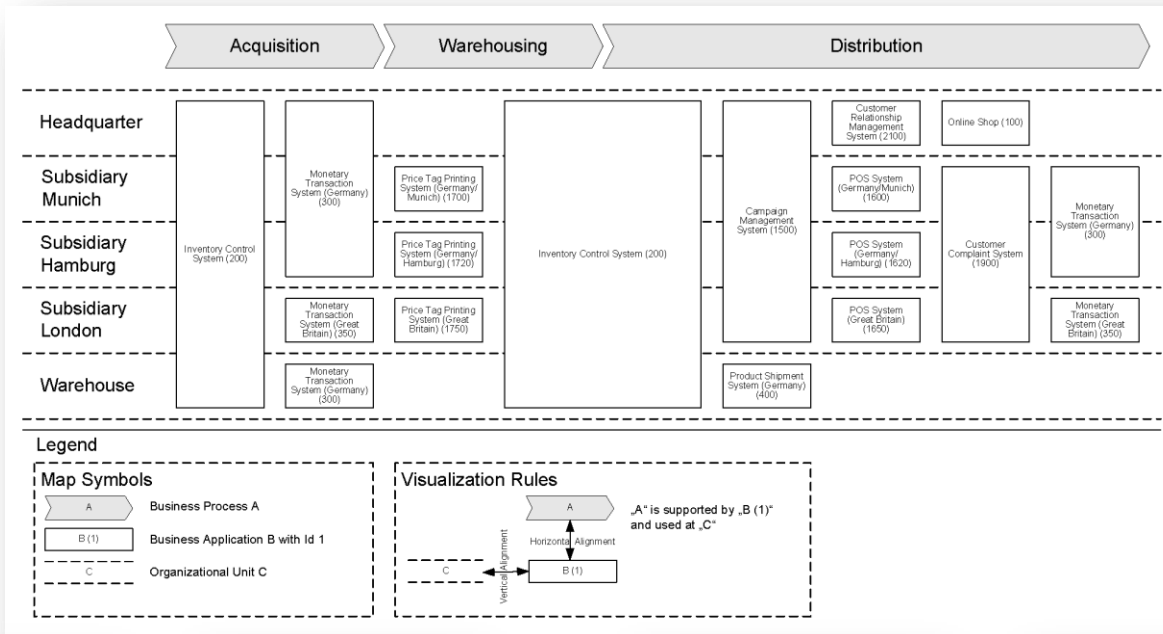

Common language for business and IT

- Technical, social and economic aspects
- Layers and crosscutting concerns
- Relationships more important than element details

+ EVOLUTION!

An enterprise architecture has to be visualized.

See <http://eampc-wiki.systemcartography.info> for more information on the **EAM Pattern Catalog**

Complex information structures

- Holistic view → lots of types and elements
- Relationships more important ... → lots of links and causal dependencies
- Multiple viewpoints → lots of attributes, documents, generated views (reports, diagrams)
- Multiple roles & processes → access rights, audit trails, notifications

Element life cycles

- demand, project proposal, budgeted project, project in execution, completed project

Evolving information structures

- Mismatch between information demand & supply
- Changing architectural concerns
- Increasing maturity of the EAM function

Special-purpose repositories

- EAM tool, process modeler, CMDB, project portfolio tool, requirements manager, ...

Example: EAM within the IT organization of a medium-sized financial service provider

IT Governance

Anfo.-mgmt.

Marketing & Communication

Business Consulting

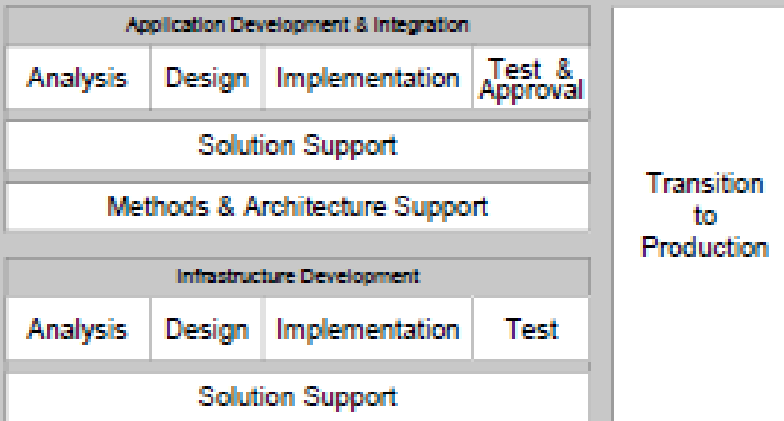

Demand Specification

Solution Strategy

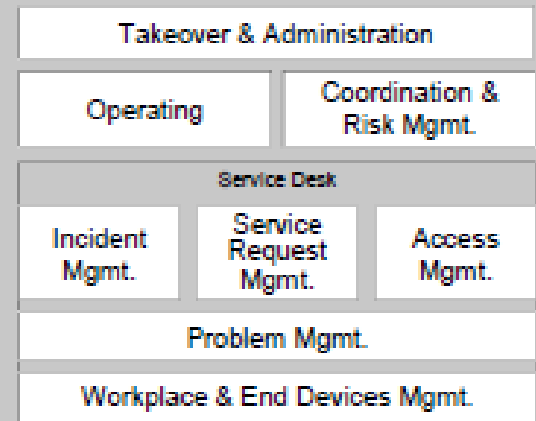

IT Management

Solution Delivery

Service Operations

Service Lifecycle Management

Example: What is an application and what are its components and interfaces?

Ontology Integration and Evolution Problem

Application, deployed application, business component, technical component, service, license, service Instance, Interface, connector,

→ $10^1 - 10^2$ Classes / Entity Types
+ Attributes + Relationship Types

Federated Linked Data Management Problem

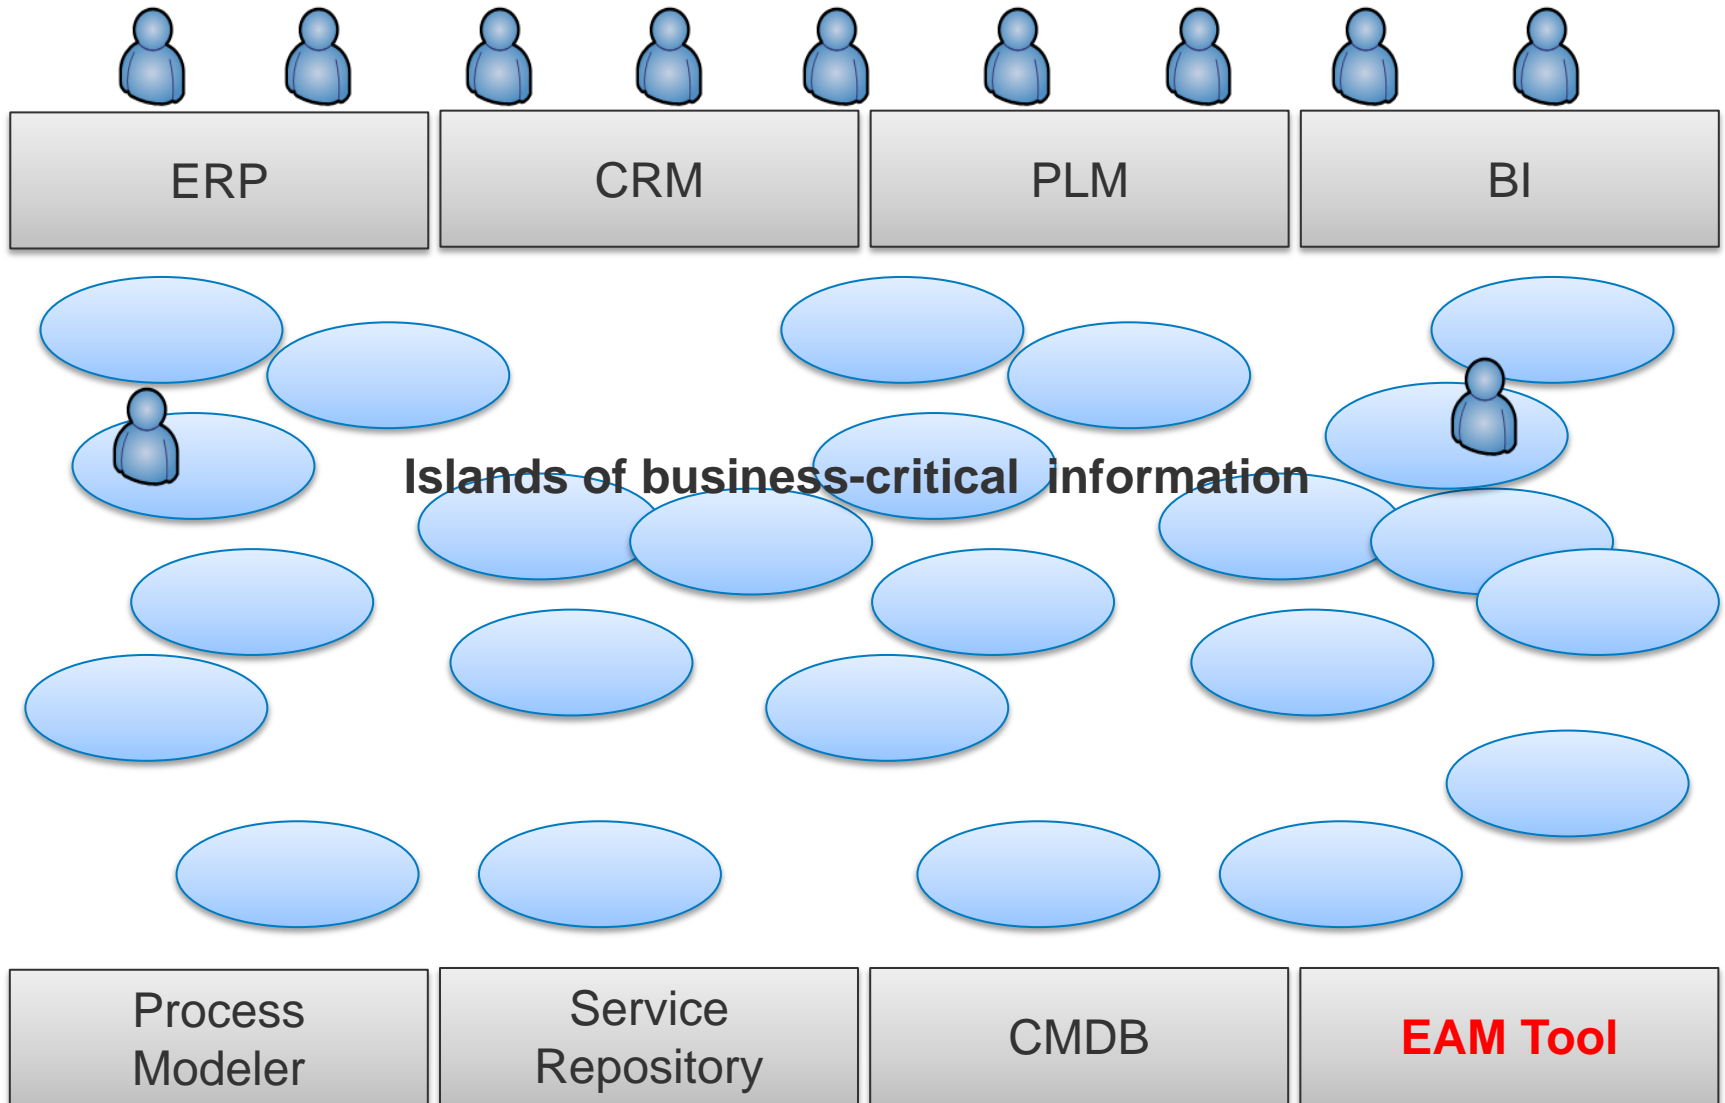

Identity, Lifecycle, Ownership, Name Space, Access Rights, Versions, Consistency Rules, Conflict Resolution, Data Provenance, ..

→ $10^3 - 10^6$ Objects / Instances
+ Attribute values + Links

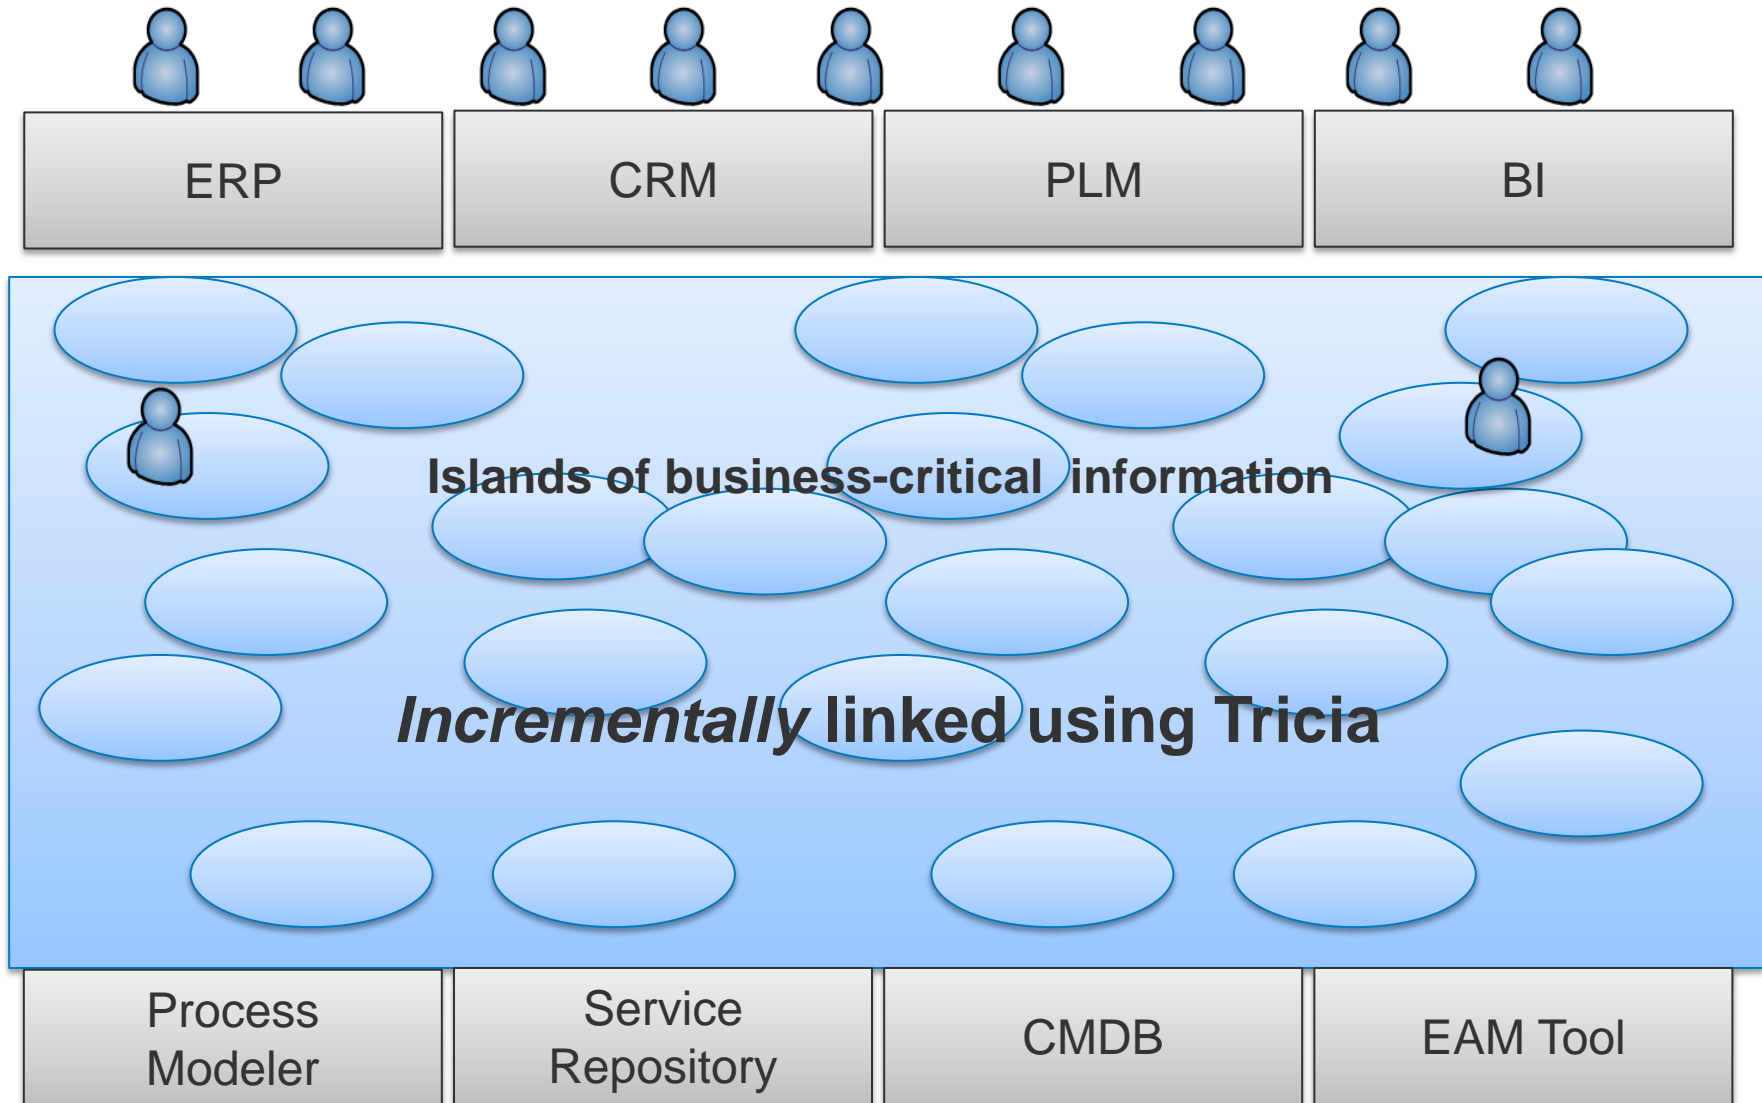

1. Key challenges in enterprise architecture modeling
2. Tricia – Enterprise information management and collaboration using hybrid wikis
3. Summary

IT until now focuses on structured information and automated processing.

Tricia reduces the gap between structured and unstructured enterprise information management.

Tricia incrementally increases coherence by providing balanced benefits for all relevant stakeholders.

Users immediately become more productive

- web and desktop access
- searches, tags, links, notifications, versions.

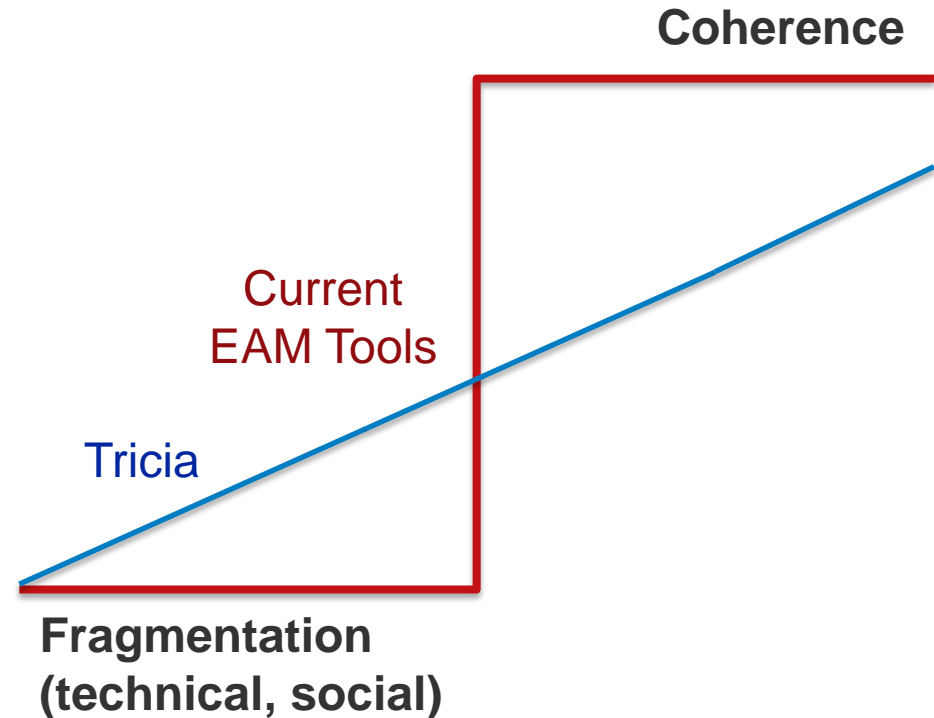

Teams can define

- information structures & consistency rules
- views & processes for their collaborative work.

The enterprise provides unified and secure access to structured and unstructured information

- groups & access rights
- open web standards

Interest / Customers

- act! consulting
- Adidas
- Canada Life
- Landschaftsverband Rheinland
- LVM Versicherung
- Iteraplan
- Novartis, ...

EAM Tool

- Bundesrechenzentrum Österreich
- Münchener Verein
- e.on

Capture non-structured and structured information in a unified way.
